ABSTRACT

This inventory lists the isotopes which have been concentrated electromagnetically, along with the completed information on their enriched abundances, and the element weights and product forms available in milligram quantities to users on Atomic Energy Commission projects and in university and industrial laboratories.

INTRODUCTION

This report of electromagnetically enriched isotopes is revised frequently to include all isotopes which are available for use, or are in the process of chemical refinement. The most recent information on the isotopic abundance of each enriched sample and the amount of each isotope in the inventory is also listed. The list also includes those isotopes which have been concentrated but are not available at present.

All weights reported are element weights converted from compound weights by standard gravimetric factors.

Isotopic abundance data not available upon shipment of material will be forwarded to requestor as soon as available.

Isotopic abundance data not in this report, such as concentrations of other isotopes in the sample, will be submitted upon request. On all shipments, however, complete isotopic abundance data will be forwarded together with a spectrographic analysis.

On all shipments material will be shipped in the product form shown, unless special arrangements are made for further chemical processing.

Any users of isotopes who need mass analysis services should check with the Isotopes Division of the A. E. C. regarding their specific needs.

Isotopes produced by the electromagnetic process are available in milligram quantities for distribution on loan within and outside of the Atomic Energy Commission and may be requested by using A. E. C. form 100. Copies of this form may be obtained from the Isotopes Division, U. S. Atomic Energy Commission, P. O. Box "E", Oak Ridge, Tennessee. Users of Stable Isotopes who need an extension of the loan period should write The Isotopes Division, Atomic Energy Commission, Oak Ridge, Tennessee.
