This is to confirm our previous conversations to the effect that the Medical Department agrees that the effluent water from the settling pond may be increased in activity by a factor of 5 over the former rate of discharge to allow for a more rapid discharge from W-5 and W-6 tanks, begun on October 14, 1944.

The above increase is based on calculations of the amount of activity previously discharged in to the White Oak Creek, monitoring of mud, water, and debris throughout White Oak Creek and the Clinch River, and discussion by J. G. Hamilton in his letter to R. S. Stone of October 11.
