Hand Counter Located in Building _____. Calibrated: Yes _____ No _____

REMARKS Items bagged at toolroom; no "before" readings; use location unknown.
Operator requested an audit of the effectiveness of the normal laundry cycle (hand cleaning) for various assortments of work clothing.
Reportedly washed individually, manually in bicarbonate of soda water, then "Tide", and then rinsed.
The items checked are free of detectable radioactive contamination.

REMARKS (1) Employee had been loading contaminated cornella into washer. There bins per washer; 80# per bin (formerly 100# per bin).

Operator requested an audit of the effectiveness of the normal laundry cycle for cornella, (using soap and bicarbonate of soda) relative to the removal of radioactive contamination.

UNSAFE ACT OBSERVED

1. Suspended Load Carried Over Employees
2. Failed to Use Crane Hand Signals
3. Failed to Use Warning Device
4. Regularly Used Limit Switch to Stop Motion
5. Materials Stored, Mixed, or Combined to Create a Hazard
6. Flammables Handled in Unapproved Safety Can
7. Incorrect Tool Used
8. Unsafe Tool Used
9. Tool Used Improperly
10. Machine Operated at Unsafe Speed
11. Machine Left Running Unattended
12. Operating With Safety Device Removed
13. Incorrect Safety Device Used
14. Operating With Safety Device Improperly Adjusted
15. Respiratory Protection Not Worn
16. Improper Respiratory Protection Worn
17. Machine Operating during Cleaning, Adjusting, Oiling, Calipering or Refueling
18. Working on Equipment Not Secured Against Unexpected Operation
19. Passenger Permitted to Ride in Unsafe Manner
20. Operable Radiation Survey Meter Not at Job Site
21. Work Permit Issued to Allow Entrance to Vessel or Enclosure, when Unsafe Because of Temperature, Gases or Electric Hazards
22. Entrance Made (Under Unsafe Act No. 21)
23. Welded, Packed, Gasketed or Caulked Equipment Under Pressure
24. Film Badge Not Worn
25. Eye Protection Not Worn
26. Improper Eye Protection
27. Hard Hats Not Worn
28. Gloves Not Worn
29. Smoking in Posted Areas
30. Eating in Posted Areas

RADIATION MONITORIN. ND CONTROL REPORT

Division: Maintenance
Department: K-1002
Location: K-502-2 Cell 9 A line job

Date: 2-14-61 Jr
Checked by: B C Burrell

Procedure: (1) Check instrument calibration; (2) Record all alpha contamination readings above the P.A.L.; (3) If all readings are less than the P.A.L., record the highest reading obtained; (4) For Beta + Gamma Radiation and Airborne Activity, record as indicated below.

Area or Equipment Checked	Approx. Area Contam. ft2	Alpha Counts/Minute		Beta + Gamma Radiation			Airborne Activity Samples			
				mrep/hr		7.5 mrep/hr	Sample Number	Time Started	Volume (ft3)	Alpha Counts/min/ft3
		Surface	Wipe	Surface	1 ft	Distance (ft)				
equipment & openings				7	—	—				
flow area	20	900	slag							

Action Taken: The above readings indicate a very slight spread of contaminates. Installation of covers over all equipment openings greatly aided in the control of contaminates. (over)

Approved: W. H. Luckett
Operating Supervisor

SUMMARY	No. Taken No. > P.A.L. % > P.A.L.		For Samples > P.A.L.			No. Wearing _____ No. Present _____ % _____	Total Act. _____ Av. _____

The over-P.A.L. activity occurred while making initial cut, when system was first opened, and while cutting inside a converter head. Air activity after the 10:00 o'clock break was below P.A.L. as noted on other previous jobs. Respiratory usage was 92% at times of high air activity. Eye protection usage was 60%.

ALPHA CONTAMINATION AUDIT REPORT

:ation K-502-3 Maintenance Truck Room (3043) Date 3-10-61

Supervisor in Charge _____ Total Work Area 300 ft^2

Operations in Progress none

Protective Measures in Force _____

SUMMARY:

		This Survey	Last Survey
ALPHA CONTAMINATION	Index	0	0
	Area Factor (Total)	0	0
	Area Factor (Wipe)	0	0

SPECIFIC LOCATION	Area (ft^2) and Class of Contamination				Maximum Reading (c/m)	
	Surface		Wipe		Surface	Wipe
All surfaces <100						

	Range Surface	(c/m) Wipe	Weighting Factor			
Class 0	*	–	0	Total ft^2		
Class I	500-2000	100-500	1		0	
Class II	2000-10,000	500-2000	5		0	
ss III	> 10,000	> 2000	20		0	
			Grand Total (ft^2)		0	

*Class 0 is area which is below the P.A.L. for surface reading but above the P.A.L. for wipe contamination.

RADIATION MONITORIN CONTROL REPORT

Division Maintenance
Department 1002
Location K-502-3 Cell 6

Date 5-22-61

Checked by B C Burrell

Procedure: (1) Check instrument calibration; (2) Record all alpha contamination readings above the P.A.L.; (3) If all readings are less than the P.A.L., record the highest reading obtained; (4) For Beta + Gamma Radiation and Airborne Activity, record as indicated below.

Area or Equipment Checked	Approx. Area Contam. ft2	Alpha Counts/Minute		Beta + Gamma Radiation			Airborne Activity Samples			
				mrep/hr		7.5 mrep/hr				
		Surface	Wipe	Surface	1 ft	Distance (ft)	Sample Number	Time Started	Volume (ft3)	Alpha Counts/min/ft3
							12	8 Am		0.13
								8:30		0.03
flow area	32	1600	250					9:00		0.17

Below are some inside cell observations:

* 6/10 Mechanics were wearing respiratory equipment when necessary
Total Personnel Checked

8/8 Welders wore respiratory equipment when necessary
Total Personnel Checked

2/2 electricians wore respiratory equipment when necessary
Total Personnel Checked

14/14 Checked for Rad radiation on hands, shoes, clothes
Total Personnel Checked

* The Mechanics were in Violation.

RADIATION MONITORIN .ND CONTROL REPORT

Division Maintenance
Department 1002
Location K-502-3 Cell #10

Date 4-24-61
Checked by B C Burell

Procedure: (1) Check instrument calibration; (2) Record all alpha contamination readings above the P.A.L.; (3) If all readings are less than the P.A.L., record the highest reading obtained; (4) For Beta + Gamma Radiation and Airborne Activity, record as indicated below.

Area or Equipment Checked	Approx. Area Contam. ft2	Alpha Counts/Minute		Beta + Gamma Radiation			Airborne Activity Samples			
				mrep/hr		7.5 mrep/hr				
		Surface	Wipe	Surface	1 ft	Distance (ft)	Sample Number	Time Started	Volume (ft3)	Alpha Counts/min/ft3
floor area	26	1100	150							
equipment openings				10	—	—				
Center of area						*	M-148	12:58	165	0.31

Action Taken: This sample was taken during cutting away equipment. Equipment was blanked off where feasible and "Decontamination Services" work helped to keep the spread of contamination to a minimum (over)

3 Wore film badge
3 Total Personnel Checked

* 3 Wore respiratory equipment
3 T.P.C.

** 0 Checked < Pol radiation on hands, shoes, clothes
2

No eating, smoking or drinking was observed on job

Very little Vestal gas was noted emitting from system indicating a good purge.

* only part time had or used his respiratory equipment

** Cleaned shoes showed to within the Pol. exchanged contaminated gloves for clean ones.

Below are some on the job observations:

* 2 Were respiratory equipment when necessary
3 Total Personnel Checked

3 Were Company Coveralls, shoes, gloves, underwear
3 T.P.C.

** 2 Were film badges
3 T.P.C.

No smoking or eating was observed on job
Mechanics were able to avoid equipment openings.

* one (1) Mechanic had only part time use of respirator
** Was observed without film badge use.

3 Total Per. Checked

* 1 Checked for Pol. radiation on hands, shoes, clothes
3 Total Per. Checked

A "hazardous work permit" was issued for job.

Old filter was properly tagged as a real cap in hazard and shipped to K-1410 for cleaning. Mechanics were able to avoid equipment openings. No smoking, eating or drinking was observed on job.

* Gloves for cleaning were and shoes to within the Pol.

exchanged Coverall and was able to wash

MEMO **AVOID ORAL INSTRUCTIONS**

Bldg. 86
Survey

Date July 26 1961

To A. F. Becker

K-1405

The last time that any pulverizing was done in K 1405 was approximately 4 weeks ago when 180 lb of finely divided material was needed as starter material in an experimental fluidbed reactor. The pulverizer has not been used since for pulverizing uranium and it is not anticipated that it will be used in the immediate future.

When it is used the material is hand fed and there is some dusting at the exhaust. Operating personnel are instructed to wear respiratory equipment

MEMO TO FILE

SUBJECT: K-1410

December 15, 1961	-	All equipment from K-1131 decontaminated except for vertical fluorinator (Gizmo).
December 28, 1961	-	Soak tank drained and cleaned - samples taken.
January 9, 1962	-	Vertical fluorinator wrapped with polyethylene plastic and tagged for disposal at X-10.
January 15, 1962	-	Gizmo and three drums of material from Gizmo removed from K-1410 to X-10 burial grounds. All operations in K-1410 completed.
January 17, 1962	-	Water turned off - Steam left on until sprinkler system converted to dry system. No decontamination anticipated.

SUBJECT: Job Survey - Disposal of Vertical Fluorinator

On December 15, 1961, the head of the Chemical Operations Department requested health physics coverage of the cleanout and decontamination of a vertical fluorinator in K-1410. This equipment had formerly been used in K-1131 and had been used to process Hanford reactor waste and normal uranium feed materials. Due to improved technology, the fluorinator had been removed from operation several years previously. It was estimated to contain 3000 pounds of material.

A beta-gamma survey of the equipment found radiation levels from 25 mr/hr gamma on the shell surface at the top to 200 mr/hr at the stuffing box for the rotary tray drive shaft on the bottom of the shell and at a discharge nozzle on the bottom of the shell. Levels dropped to below 7.5 mr/hr at a distance of approximately 3 feet from the high points on the bottom of the shell.

Film rings and pocket dosimeters were provided to one operator and one surveyor from the Safety and Health Physics Department. Samples of solids were taken from a nozzle in the upper shell head and from the discharge nozzle in the bottom. These were taken to the Technical Division Counting and Quantitative Laboratory on December 15, 1961, with a request for a check on total beta count, and quantitative radiochemical determinations of Pu^{239}, Sr^{90}, Cs^{137} and uranium.

An operator wearing a dust respirator and furnished with a film ring and pocket dosimeter placed a drum under the discharge nozzle, enclosed the drum and nozzle with plastic to prevent dust spread, and proceeded to remove about 200 pounds of solids by pounding on the discharge nozzle with a hammer. No spot air samples were taken during this operation; however, a continuous air monitor operating nearby showed no unusual activity. Pocket dosimeter readings at the end of the day were negligible and were not recorded. Film rings developed after completion of the job were negative.

On December 18, 1961, a steam hose was placed in the discharge nozzle of the fluorinator and live steam was circulated through the vessel. A 55-gallon drum was placed below the discharge nozzle to catch the condensate. On December 19, 1961, a check was made with the laboratory for results and it was determined that their equipment was inoperative, and no work had been done. Therefore, on December 19, 1961, a sample of solids from the first drum was obtained and taken to Y-12 for a quick qualitative check on their gamma scanner. Unfortunately, their equipment was inoperative, and it was not until December 22, 1961, that Y-12 indicated that the sample contained significant gamma activity due to Cs^{137}. It was also recognized that other fission products with their associated health problems were likely to be present so that steaming was immediately stopped. All flanged openings were sealed, and covers were placed on the drums of material removed. The drums were isolated to prevent their being inadvertently processed in recovery equipment and fed to the plant process stream. The continuous air monitor

at this location showed no unusual air activity during the steaming period and a survey of the floor indicated no unusual surface activity.

No further work was done until the laboratory radiochemical analysis results were available.

Partial results were obtained from the laboratory on December 29, 1961; however, it was not until January 9, 1962, that all results were obtained. These were as follows:

Sample	Pu^{239}/U	Sr^{90} µµg/g sample	Cs^{137} µµg/g sample	gU/g Sample	Total β d/m/g	Sr^{90} β d/m/g
#1 Top	0.4 ppm	1,468	700	0.534	1,500,778	462,700
#2 Bottom	47 ppm	7,319	1000	0.0086	5,999,242	2,307,000

These results were as expected from fission product waste after a decay period of approximately five years.

Realizing that ORGDP was not equipped to recover this material and because of the health problems which would be involved in decontamination, it was decided that the equipment and material should be disposed of at the ORNL contaminated burial ground. On January 9, 1962, the fluorinator was prepared for burial by wrapping with two layers of polyethylene sheeting and loaded on a low-boy for transporting to ORNL. The equipment was surveyed, and the appropriate labels attached. On January 15, 1962, the equipment was transported to ORNL. The fluorinator was handled by ORNL personnel while the three drums were taken to a disposal pond and dumped. The disposal was satisfactory and without incident.

Reply Message

FOLD

MESSAGE

N. D. Becker and myself looked at the electrical relaying gear on a refrigeration unit for "H" area K1420. It is felt that it would be acceptable from a safety standpoint however, it was suggested that a rubber gasket be placed between the box and its cover and additional hold down screws be provided to prevent inleakage of water. This information will be forwarded to George Doyle of Engineering

PROJECT ENGINEERING DEPARTMENT

SCOPE OF PROJECT

ISSUE NO. 1

Project No: M-28275-A

Date: August 31, 1961

Project Engineer: Doyle

Title: Dry Booth Fixtures, K-1420

SUMMARY OF MEETING

A meeting was held at 12:30 p.m. on August 24, 1961, with the following men present:

Plant Engineering Division	Chemical Operations Department	Nuclear Hazards Department
R. I. Deaderick	R. J. Clouse	C. E. Newlon
G. M. Doyle		
W. Halchin		
M. C. Martin		

The design on this project covering a compressor ran dolly and a compressor disassembly dolly did not provide means to pull the rotor from a size 29 or 31 axial compressor. This meeting was held to discuss what provisions will be used to remove these rotors. After some discussion on the possible methods of removing the rotor only or the rotor and stator together, it was decided that the rotor would be removed separately by supporting one end with the overhead crane and pulling it out with a chain hoist. To keep the rotor from falling down against the stator after the stub shaft has been removed from the bearing, rails made from channel irons would be cut in the field and fitted under the rotor; then the rotor would be slid out on these rails. After removal of the rotor, the stator will be removed with the designed fixtures.

The design of the compressor disassembly dolly will be changed to eliminate the rotating table. Compressors will then be disassembled by working on one end in the west side of the drying booth and then moving the dolly and compressor into the final rinse booth so that the other end of the compressor can be disassembled in the west end of the drying booth.

REMARKS: Leaks remain about the same, however most of the floor had been painted on first floor level - But this was offset by increases on mezzanine. The increases on mezzanine were caused largely by continuous dissolver spills and work on Hoppers in "E" Area.

Subject Special Air Sampling Program: K-1420 Calciner Area

As requested, a series of samples were obtained to evaluate the effect of the calciner and drum dryer operations on the environmental air in the "B" Area. Four individual checks were made in the area of "C" drum dryer and calciner with five samples taken each time, all of which were completed by March 16, 1961. The first test was made to determine background alpha activity, at which time only the drum dryer was in operation. The second test included a period during which the operator was rodding the calciner as is usual practice, and this took approximately three minutes. The third test was similar to the second except that a hose connected to the building vacuum system was placed immediately above the calciner opening during the rodding operation. The fourth test involved a check to determine "background" air activity with all of the equipment off. Figures 1 and 2 show the approximate locations of the sampling equipment.

The tests were conducted with uranium materials with a U-235 enrichment of 2%. As the isotopic enrichment is increased, and since the mass involved would be expected to remain the same, air activity can be expected to increase by about the same factor due to the increased specific activity.

SPECIAL AIR SAMPLING PROGRAM: K-1420 CALCINER AREA

GENERAL AIR

A. Main Floor - Front

The background alpha air activity at this location was 0.052 c/min/ft^3. During a three-minute rodding operation, the air activity increased by a factor of slightly greater than three to 0.160 c/min/ft^3. During the three-minute rodding operation when a vacuum hose was held over the rod opening, the activity was only slightly above background at 0.08 c/min/ft^3.

B. Main Floor - West Side

The background alpha air activity of 0.280 c/min/ft^3 was the highest measurement obtained at this location. During the two rodding operations, the respective air activities were 0.120 c/min/ft^3 and 0.060 c/min/ft^3. The background air activity at this location was not significantly affected by operations at this time.

C. Drum Dryer Platform - West Side

Only one sample was taken at this location. The activity was 0.685 c/min/ft^3 which is mainly due to the drum dryer operation.

D. Catwalk from Mezzanine - Directly Above Drum Dryer

The air activity at this location is affected by the operation of the drum dryer. Two background samples were taken, one with the drum dryer in operation and the other with the drum dryer off. These activities were 0.255 c/min/ft^3 and 0.075 c/min/ft^3, respectively. During the two 3-minute rodding operations previously described, the activity increased to 0.408 c/min/ft^3 in the first instance and 1.05 c/min/ft^3 in the second. The exact operational variations contributing to these increases could not be determined.

BREATHING ZONE AIR (CORRESPONDS TO OPERATOR WORK POSITION)

E. Sample Head Suspended Above Calciner Opening

During the two rodding operations, the air activity increased by a factor of four from the background reading of 0.410 c/min/ft^3 to 1.67 c/min/ft^3 in the first instance and by a factor of three to 1.25 c/min/ft^3 in the second instance when the vacuum hose was used.

F. Operational Sample 1½' in Front of Calciner Opening

During normal rodding operations, the air activity increased from the background measurement of 0.316 c/min/ft^3 to 1.60 c/min/ft^3. However, when the vacuum hose was used, the activity remained essentially at background with a reading of 0.40 c/min/ft^3.

From the above, it can be seen that the operation of the drum dryer and rodding operations significantly increased the alpha air activity levels in the calciner area, particularly in the breathing zone area during rodding operations and on the mezzanine and catwalk above the equipment.
